

A. Days 1-15 (damage $\leq 10\%$ of final)
 $r = -0.41$ ($p = 0.133$); slope = -1.03 ; $n = 15$ days

B. Days 16-39 (damage $10\% \rightarrow 99\%$)
 $r = +0.43$ ($p = 0.034$); slope = $+0.44$; $n = 24$ days

C. Days 40-170 (damage $\approx 100\%$)
 $r = +0.52$ ($p = 0.000$); slope = $+0.29$; $n = 131$ days

Each dot is one day. The line is the simple regression of deaths on strikes within the period; its slope is extra deaths per extra strike location. Periods follow the benchmark facility-damage curve (31 facilities by Day 15; 307 by Day 39; 309 by Day 170).
